

Ultrasound Abdomen

Patient Name : Shobhit Chola

Date : 12 May 2024

Time : 5:30 PM

Hospital : Max Hospital, Delhi

Doctor : Dr. Aniket Kumar

Report:

The patient has a known history of intermittent upper abdominal pain, especially postprandial (after meals), localized to the right upper quadrant. No recent history of jaundice or fever. The study was performed as a follow-up for suspected cholelithiasis. A high-resolution real-time ultrasonographic examination of the upper abdomen was performed in multiple planes.

Impression:

- Gallbladder appears mildly contracted, with a single echogenic calculus measuring approximately 1.2 cm in diameter located at the fundus.
- No evidence of gallbladder wall thickening or pericholecystic fluid.
- Common bile duct measures within normal limits (4.5 mm).
- Liver is normal in size and echotexture, with no focal lesions or biliary dilatation.
- Pancreas is partially visualized and appears unremarkable.
- Both kidneys appear normal in size and echotexture, with no evidence of hydronephrosis or calculi.
- No free fluid in the abdomen.
- Sonographic appearance of the spleen and abdominal aorta is normal.

Conclusion:

- Cholelithiasis (gallstones) with no signs of acute cholecystitis.
- Elective surgical consultation may be considered based on symptom severity.
- No other significant abnormality detected on abdominal scan.
