

Chest X-Ray

Patient Name : Tanish Kumar

Date : 17 May 2025

Time : 5:30 PM

Hospital : AIIMS, Delhi

Doctor : Dr. Manoj Singh

Report:

The patient has a 3-month history of recurrent upper respiratory infections with persistent post-nasal drip, occasional chest congestion, and non-productive cough. No reported fever or significant weight loss. Clinical concern includes evaluating for lower respiratory involvement or chronic inflammatory changes due to sinus drainage. A standard PA and lateral chest radiograph was performed.

Impression:

- Lung fields are well expanded bilaterally.
- Mild peribronchial thickening is noted in the right lower zone, likely secondary to chronic post-nasal drainage.
- No focal consolidation, cavitary lesions, or pleural effusion.
- No evidence of active pulmonary infiltrates or pneumonia.
- Costophrenic angles are clear.
- Cardiac silhouette is within normal limits.
- Bony thorax and diaphragm appear unremarkable.

Conclusion:

- No acute pulmonary pathology identified.
- Findings suggest chronic sinus-related bronchial irritation, but no signs of pneumonia or fluid overload.
- Symptomatic treatment and continued sinus management recommended.
- Consider ENT referral if symptoms persist or worsen.
